

*You have received the NHS Diabetes Prevention data pack in order to facilitate the monitoring and targeting of health equalities.*

**These data have been supplied to you on a confidential basis and are not for wider circulation outside your Local Health Economy.**

The data packs contain **small numbers** and cannot be released publicly without contravention of the Data Protection Act. They also, for the first time, contain outcome data at six months which are particularly sensitive.

We will continue to distribute these data to you since the breakdowns they contain are essential for monitoring purposes.

However, it is essential to control the dissemination of these data.

Therefore:

**1) If you wish to share these data internally within your organisation then you must suppress all counts associated (directly or indirectly) with counts between 1 – 4.**

**2) If you have any concerns or questions please contact: [england.ndpp@nhs.net](mailto:england.ndpp@nhs.net)**

This packs contains;

- Numbers of referrals (and rate per 100,000 adult population)
- Numbers of participants who attended the Initial Assessment (IA)
- Characteristics of participants who attended IA (by age, sex, ethnicity, deprivation and BMI)

Outcome data included:

- Numbers of participants who attended the first intervention session (IV1)
- Numbers of participants who attended the six month session
- Mean weight change at six months for participants who had a valid weight recorded at IA and six months

Please also note;

-There is a time lag from referral to attendance of IA and from attendance of IA to IV1. Therefore, the overall uptake is expected to increase. We have included uptake for referrals received up to July 2017 to give an indication of what we expect the overall uptake to increase too.

-The number of participants who attended the six month session cannot be used as a measure of retention (i.e. as a proportion of participants who attended IV1) since not all participants who attended IV1 will yet have had time to attend the six month

## Site Name

Overall site referrals split by Status for Site Name CCGs

Drop Outs and when they left the programme by CCG for Site Name CCGs

## Summary For Site Name

**This summary report may contain small numbers and must be suppressed if sharing internally**

There have been 7983 referrals made into the NHS Diabetes Prevention Programme (DPP) in Site Name; a rate of 519 per 100,000 adult population. Of these referrals, 2556 have attended an Initial assessment (IA), an uptake of 32%. To date, there have been 846 participants who have attended the first intervention session (IV1); 33% of participants who attended IA. (Graphs 1-4 by CCG)

To note; there is a time lag between referral and attendance of IA and from IA to IV1. Therefore, the overall uptake from referral to IA and from IA to IV1 is expected to increase. For referrals received up to October 2017, 42% of referrals have attended an IA and 49% of participants who attended an IA, attended IV1.

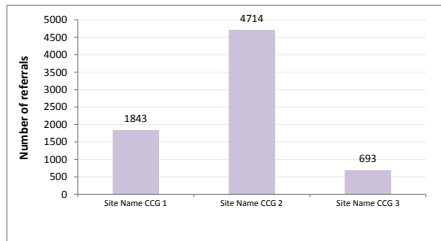

Of the referrals who have attended an IA;

- 41% were male and 74% were aged less than 70 (graph 5),
- 49% were of black, Asian, mixed or other ethnicity (graph 6),
- 52% were from the most deprived quintile compared to 7% from the least deprived (graph 7),
- 15% are of normal weight (BMI 18-24.9), 40% overweight (BMI 25-29.9) and 45% obese (BMI >30) (graph 8),

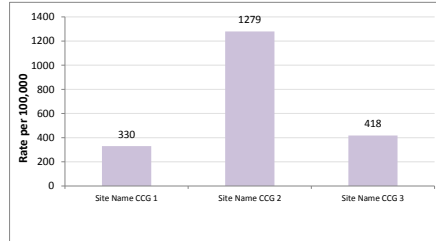

To date, there have been 102 participants who have attended the 6 month session; 102 have a valid weight recorded at both IA and 6 months. The mean weight at IA was 80.7kgs and the mean weight at 6 months was 78.3kgs, giving a mean change of -2.4kgs (Graphs 9-10 by CCG).

Note, the number of participants who attended the 6 month session cannot be used as a measure of retention (i.e. as a proportion of participants who attended IV1) since not all participants who attended IV1 will yet have had time to attend the 6 month session.

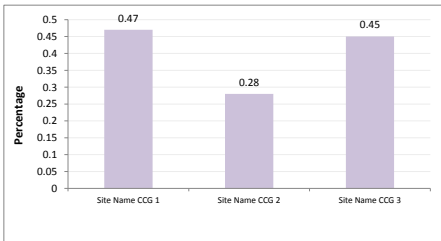

**Graph 1: Number of referrals**

**Graph 2: Rate of referrals per 100,000**

**Graph 3: Percentage of referrals who attended an IA**

**Graph 4: Percentage of participants who attended IA who attended IV1**

**Graph 5: Percentage breakdown of referrals who attended an Initial Assessment by age-group**

**Graph 6: Percentage breakdown of referrals who attended an Initial Assessment by ethnic group**

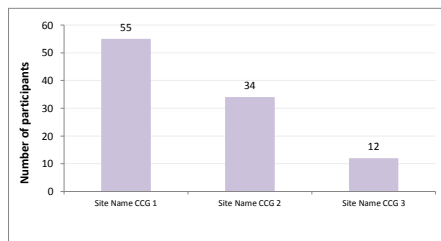

**Graph 7: Percentage breakdown of referrals who attended an Initial Assessment by deprivation quintile**

**Graph 8: Percentage breakdown of referrals who attended an Initial Assessment by Body Mass Index (BMI)**

**Graph 9: Number of participants who attended the 6 month session**

**Graph 10: Mean weight change at 6 months for participants who had a valid weight at IA and 6 months**

## Notes on Measures

Please use the + symbols above the measures to expand the display. This will allow you to drill down into the column's data further eg expanding the + above column Referrals to Date in the Performance Dashboard allows you to see the source of referral.

### Demographic Dashboard

This data is for those who have attended an IA.

Please use the combobox to choose either:

Number - Raw numbers of IA attendees to date

% Breakdown - Percentage of all IA attendees to date

Rate Per 100,000 - Uses population statistics to create standardised per 100,000 population rates to allow for meaningful comparison across CCGs. This is only provided for the highest referring CCGs.

Demographic	Notes
Sex	The NDPP MDS collects F, M, Indeterminate, Not Known/Stated. ODS population data only classifies individuals as M or F so there are only rates per 100,000 population for M and F.
Age Band	The NDPP MDS uses Age of Referral here. UNK includes anyone with an Age of Referral < 18.
Ethnicity	
BMI	Any BMIs < 18 have been grouped with UNK. BMI have been grouped to 1 decimal place eg a BMI of 29.9 will be grouped into 25-29.
Deprivation Quintile	Most deprived areas = 1.

ONS population estimates mid 2016 for CCGs in England by single year of age and sex have been used in this report.

NDH registered proportions from PHE 2015 have been applied to the mid 2016 population figures to give estimated numbers of NDH population.

Census 2011 ethnicity proportions have been applied to ONS mid-2016 population estimates to estimate ethnicity mid-2016 populations.

### Performance Dashboard

#### Programme Progression

All referrals to date have been classified into three main statuses - Drop Outs, Active and Completers.

Drop Outs have a date of participant non-completion.

Finishers have a date of completion eg have finished the programme and are not expected to have any further sessions booked.

Active records are those who have neither a date of non completion or a date of completion.

Drop Outs have then been grouped into the following 3 types:

Drop Out Type	Definition
	Did not have an IA attendance. These have been further split into Active - Pre-IA <= 30 Days, which are referrals who are open and have not yet had an IA attendance, and have 30 or less days since their date of successful contact where there is one, or date of referral where there isn't a successful contact date.
Pre-IA	Additionally those who have greater than 30 days since this are shown.
IA	Attended an IA but did not attend any further sessions
Post-IA	Attended IV sessions but then dropped out

Active Referrals have also been grouped into 6 types:

Active Referral Stage	Definition
	Have not yet had outcome an IA. This group have been split into two subsets - those who are pre-IA but have 30 days or less since either a successful date of contact where there is one OR date of referral where there is no successful contact, and those who have more than 30 days since last significant event (referral date / successful date of contact). The aim of this is to identify how many are longwaiters eg referrals who have not had anything done with them in 30 days.
Pre-IA	The latest session outcome is an IA. This is not the same as achieving MS1 as it doesn't give any indication of blood test, it just indicates that the greatest session outcome is IA
Max Booked MS1	The latest session outcome is within MS 2 course period for the relevant provider. This is not the same as achieving MS2 as it doesn't give any indication of overall time attendance, it just indicates that the greatest session outcome is within MS2 course period for the provider.
Max Booked MS2	The latest session outcome is within MS 3 course period for the relevant provider. This is not the same as achieving MS3 as it doesn't give any indication of overall time attendance, it just indicates that the greatest session outcome is within MS3 course period for the provider.
Max Booked MS3	The latest session outcome is within MS 4 course period for the relevant provider. This is not the same as achieving MS4 as it doesn't give any indication of overall time attendance, it just indicates that the greatest session outcome is within MS4 course period for the provider.
Max Booked MS4	The latest session outcome is within MS 5 course period for the relevant provider. This is not the same as achieving MS5 as it doesn't give any indication of overall time attendance, it just indicates that the greatest session outcome is within MS5 course period for the provider.
Max Booked MS5	The latest session outcome is within MS 6 course period for the relevant provider. This is not the same as achieving MS6 as it doesn't give any indication of overall time attendance, it just indicates that the greatest session outcome is within MS6 course period for the provider.

#### Mean weight change at Six Months

Mean weight change has been calculated by comparing starting and 6 month weights for those records that have both values populated.
